

Testing on live application

SESSION-2 Responsive Testing & Cross Browser Testing

1. Open Zomato.com in Chrome, press F12 to open DevTools, and use the device toolbar to simulate the site on iPhone 12, iPad, and a standard desktop. List 3 layout or UI changes you observe between these views.

Ans: Responsive Testing -Zomato

1. Navigation Menu Changes

- In **iPhone 12**, the navigation options are collapsed into a hamburger menu.
- In **iPad**, some menu options are visible while others remain collapsed.
- In **Desktop**, all navigation links are displayed on the top bar.

2. Content Layout Changes

- **iPhone 12** shows restaurant cards in a single-column layout.
- **iPad** displays content in two columns.
- **Desktop** uses a multi-column grid layout to show more restaurants at once.

3. Search Bar and Images

- The search bar and images are compact in mobile view.
- They become larger and better spaced on iPad.
- Desktop view shows a full-width search bar and larger banners.

2. Pick any Flipkart product page and resize your browser window from desktop width down to mobile width. Note at which pixel widths (breakpoints) major layout shifts happen (e.g., menu collapses, grid

changes to list). List the breakpoints and describe what changes at each.

2. Flipkart Breakpoint Testing

- At around 1200px and above, the website displayed the complete desktop layout with a full navigation bar, product images on the left, and detailed product information on the right.
- At approximately 1024px, the page layout became more compact and the spacing between sections was reduced.
- At around 768px, the product details moved below the product image, and recommendation sections displayed fewer items per row.
- At approximately 576px, the navigation menu collapsed into a hamburger icon and action buttons such as Add to Cart and Buy Now expanded to full width.
- Below 576px, the layout switched to a mobile-friendly single-column view with vertically stacked content sections.
- Images, buttons, and product cards resized automatically without overlapping or breaking the layout.

3. Open Myntra.com in both Chrome and Firefox browsers on your laptop. Take screenshots of the homepage in both browsers at desktop size and compare them. Identify and describe 2 differences in how elements (fonts, buttons, images, etc.) are rendered.

Ans: Myntra Cross-Browser Testing (Chrome vs Firefox)

- The homepage layout remained consistent in both browsers, with all major sections loading correctly.
- In Chrome, fonts appeared slightly sharper and spacing between menu items looked more balanced.
- In Firefox, some text appeared marginally bolder compared to Chrome.

- Banner images loaded correctly in both browsers, but minor differences in image scaling were observed.
- Button borders and padding showed slight variations due to different browser rendering engines.
- No functional issues were identified, and all navigation links worked as expected.

4. Use BrowserStack (or CrossBrowserTesting) to test BookMyShow.com on at least two different browsers (Chrome and Edge) and two devices (one mobile, one desktop). Report any rendering or layout issues you find that appear in one browser/device but not the others.

**

Hint: Focus on navigation menus, banners, and buttons for visible differences. **

Ans: BookMyShow Cross-Browser and Cross-Device Testing

- Testing was performed on Chrome and Edge browsers across both desktop and mobile devices.
- The desktop layout was rendered correctly in both browsers with no major issues.
- On mobile devices, the navigation menu changed into a hamburger menu for better usability.
- Promotional banners resized automatically according to screen size.
- A slight delay was observed in the navigation drawer animation on Edge compared to Chrome.
- On some mobile views, button spacing appeared slightly inconsistent in Edge.
- Overall, the website remained responsive and functional across all tested environments.

5. Identify 5 responsive UI issues on any one of your favorite apps' web versions (e.g., Spotify, Instagram, Swiggy) using Chrome DevTools device simulation. For each issue, describe the problem, the device size where it appears, and suggest a possible fix.

Ans: Responsive UI Issues Found on Instagram Web

- On devices with a width of **320px**, story thumbnails extended beyond the visible screen area.
- At **768px**, the chat panel overlapped the content feed in landscape mode.
- On screens around **540px**, excessive margins reduced the visible content area.
- At **360px**, bottom navigation icons appeared closely packed, affecting usability.
- On **390px** screens, reel action buttons partially covered captions and hashtags.
- These issues can be resolved by improving responsive breakpoints, adjusting spacing dynamically, and optimizing element positioning for smaller screens.
